

2023 Alaska Harmful Algal Bloom Workshop

March 27th, 28th, and 29th 2023

Captain Cook Hotel – Aft Deck Room

Lunch, snack and coffee/tea provided each day

Goals and Objectives

To gather HAB samplers, monitors, and researchers working in Alaska and discuss community needs for HAB monitoring, research, and forecasts. Participants will share knowledge and current efforts on HABs around the state, understand the needs of different groups, and plan how to meet those needs through collaboration.

Workshop summary

This 3-day workshop will take place in person in Anchorage in March 2023 and will bring together HAB samplers, monitors and researchers working in Alaska. The focus will be on the current status of communities in Alaska in regard to HAB monitoring and research, what their needs are, and what tools could be developed to mitigate the threat of HABs. Topics to be covered include: community monitoring needs, testing technologies pros and cons, forecasting approaches and benefits, and what data and communication products would be useful for coastal communities. This will also be a chance to form and nurture relationships around the state, since the last statewide HABs meeting in Alaska took place in 2019.

A virtual option will be available, but participants are highly encouraged to attend in person. Travel support to attend this workshop in person is available.
